

Perhaps we will see that the 21.1 cm ground state neutral hydrogen spinflip is not the only spinflip state out there. There are likely to be excited, and hydronic, spinflip states to look for. Perhaps neutronic.

The 'missing mass'?

Those cosmic plasma helicoid 'clouds' are the home of as many neutrons and hydrons as electrons, protons and atoms.

Up until now we have pretended that they don't exist -- and neither the **aenertial pre-quantal waves** that make up light and matter. How's that for an 'order of magnitude' correction?

"I think we have done all that can be done."
